The End-User Persona (The Passenger)

User Profile

I am a metro passenger who needs to travel from one station to another and wants to book a metro ticket quickly without standing in a long queue. I depend on a simple digital ticket-booking system to provide accurate fare information, complete the booking process, and receive a valid ticket with QR-code information.

Core Objective

My objective is to enter my source station, destination station, ticket type, and number of tickets through a structured ServiceNow form so that the system can calculate the fare, process the booking, and generate my metro ticket with minimum waiting time.

Technical Friction Points

- **Manual Ticket Booking:** Traditional ticket counters may require passengers to wait in queues and depend on manual ticket processing.
- **Fare Calculation Difficulty:** Manual fare calculation can result in errors, especially when the passenger books multiple tickets or different journey combinations.
- **Limited Digital Tracking:** Passengers may not have a convenient way to view payment status, booking date, ticket expiry, and ticket details in one place.
- **Ticket Validation Challenges:** Physical tickets can be inconvenient to manage, while passengers need a simple digital method such as QR-code-based validation.
- **Incomplete Journey Information:** Incorrect or incomplete source, destination, ticket type, or ticket-count information can affect ticket generation and fare calculation.

Operational & Emotional Impact

These problems can make the passenger feel frustrated, delayed, and uncertain about the fare and validity of the ticket. A digital and automated ServiceNow solution can reduce waiting time, improve booking accuracy, and provide a convenient ticketing experience.

Book A Metro Ticket Item

A metro e-ticketing system allows passengers to purchase and use tickets digitally, typically via a mobile app or website, eliminating the need for physical tickets or cash transactions.

The Backend Administrator Persona (The Metro Operations Administrator)

User Profile

I work as a Metro Operations or ServiceNow Administrator responsible for maintaining station information, monitoring ticket records, validating booking details, tracking payment status, and ensuring that automated ticket-processing activities work correctly.

Core Objective

My goal is to process metro ticket requests efficiently, maintain accurate station and ticket records, ensure correct fare calculations, monitor ticket status and expiry, and make sure that every successfully submitted booking is processed without errors.

Technical Friction Points

- **Station Data Management:** Metro station names, station codes, metro lines, and city information must be maintained accurately for reliable journey selection.
- **Manual Fare Processing:** Without automation, fare calculation and ticket processing can require repetitive administrative effort and may introduce errors.

- **Lack of Orchestration:** Manual processing of submitted ticket requests can delay ticket generation and status updates. Flow Designer provides automated processing.
- **Ticket Data Consistency:** Source, destination, ticket count, fare, payment status, QR code, booking date, and expiry must be stored consistently in ServiceNow records.
- **Validation and Monitoring:** The administrator needs reliable Client Scripts, UI Policies, and automation rules to prevent invalid submissions and maintain correct ticket records.

Operational & Emotional Impact

These system deficiencies can create repetitive administrative work and increase the risk of incorrect fare values, incomplete ticket records, and delayed ticket processing. The proposed Metro Ticket Generating System reduces these problems through structured Service Catalog forms, client-side validation, automated fare calculation, Flow Designer automation, QR-code validation, and centralized ServiceNow records.

Consolidated Problem Statement

Metro passengers need a fast, accurate, and convenient way to book tickets without long queues or manual fare calculation. At the same time, metro administrators need a reliable system for maintaining station data, processing ticket requests, tracking payment and expiry information, and validating generated tickets. The Metro Ticket Generating System in ServiceNow addresses these needs through a digital Service Catalog, automated fare calculation, Client Scripts, UI Policies, Flow Designer automation, QR-code-based ticket validation, and centralized ticket records.
